

Your System 96 “FuseBox” is a variety pack of Spectrum “T-Glass.” The “T” stands for “Transition,” so named because it is often produced as we shift from one product to another in manufacture.

System 96 “T-Glass” is always 100% tested-compatible, devit-resistant, excellent-cutting, and otherwise top-performing fusible glass. It will, however, be outside of our tolerances for surface texture, seeds, color hue, mix, or density.

Most surface imperfections will disappear in the fusing process. If you wish to retain them for effect, fuse at lower temperatures using shorter hold times. The more heat your project gets (the more “full” the fuse), the more an imperfect surface will heal.

Avoid “T-Glass” where it is critical that you be able to replicate glass color from one project to the next.

And remember, we welcome your comments and questions about System 96 products. Contact us at hotglass@system96.com.
